What is Software Engineering?

- ⦿ An engineering discipline for software:
 - Development
 - Operation
 - Maintenance
- ⦿ Also involves:
 - Managing teams
 - Scheduling
 - Budgeting
- ⦿ Methodology for large software projects

Why Software Engineering?

The Software Crisis:

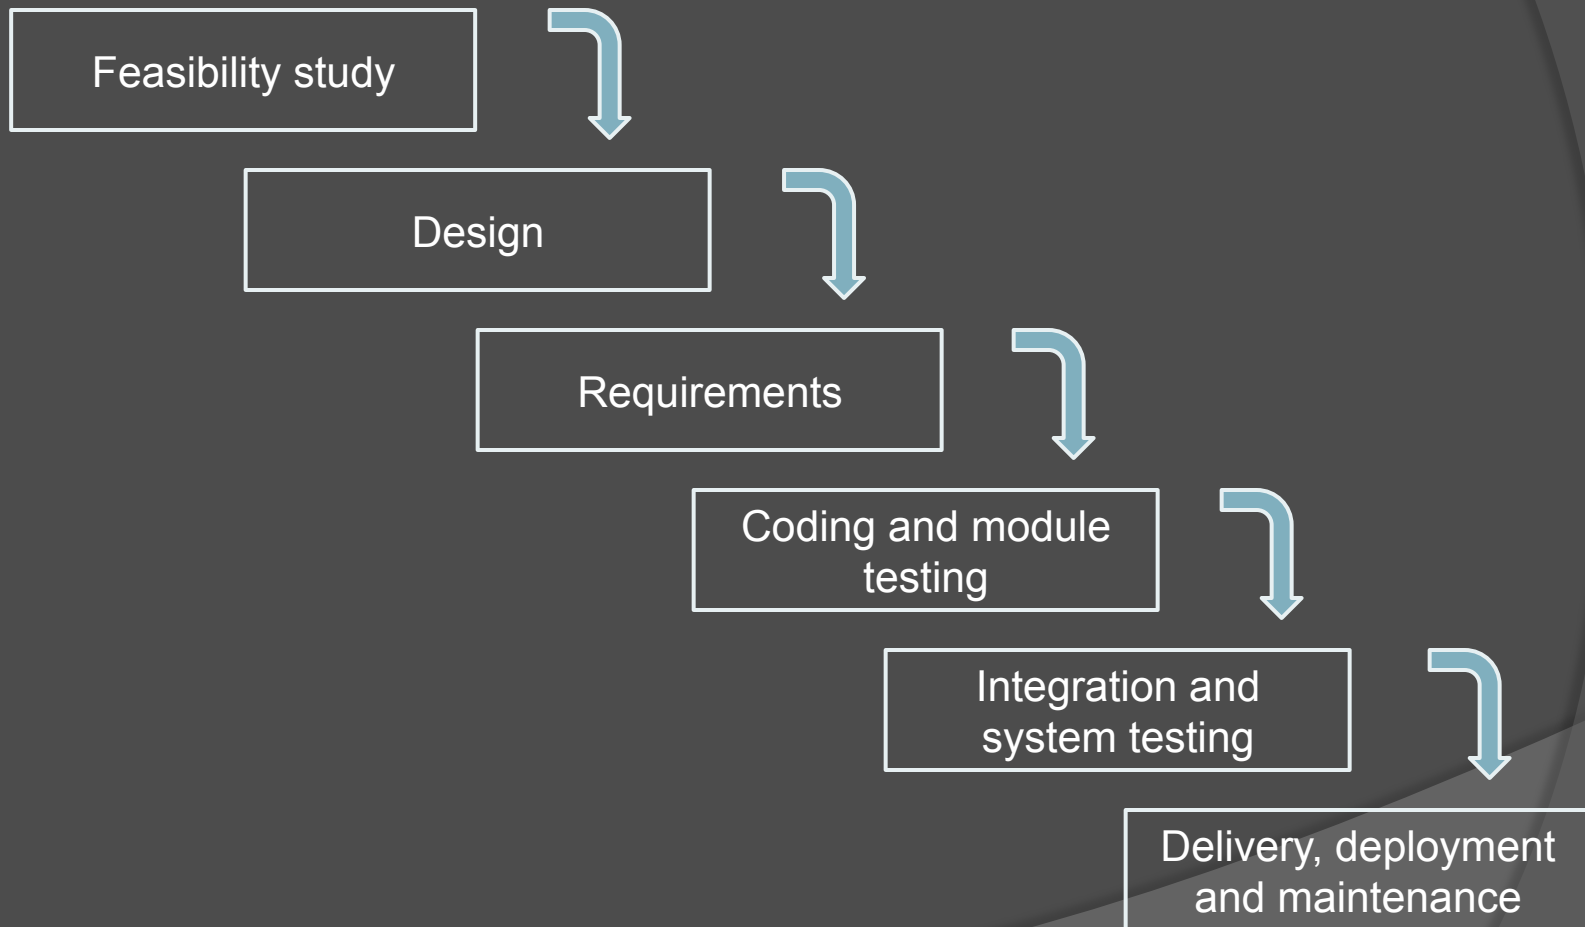

- For every 8 large projects, 2 are cancelled.
- Most projects exceed their time-schedule by 50%.
- 75% of large software systems malfunction after completion.
- Detecting and correcting errors take 50% of time and effort.
- Maintenance cost of a system is 60% of entire cost.

Software engineering tackles the software crisis by providing disciplined processes and methodologies to design, implement, and maintain large systems.

The Software Life Cycle Process

- ⦿ Requirements gathering and analysis
- ⦿ Architecture design and specification
- ⦿ Coding and testing
- ⦿ Delivery and deployment
- ⦿ Maintenance and evolution
- ⦿ Retirement

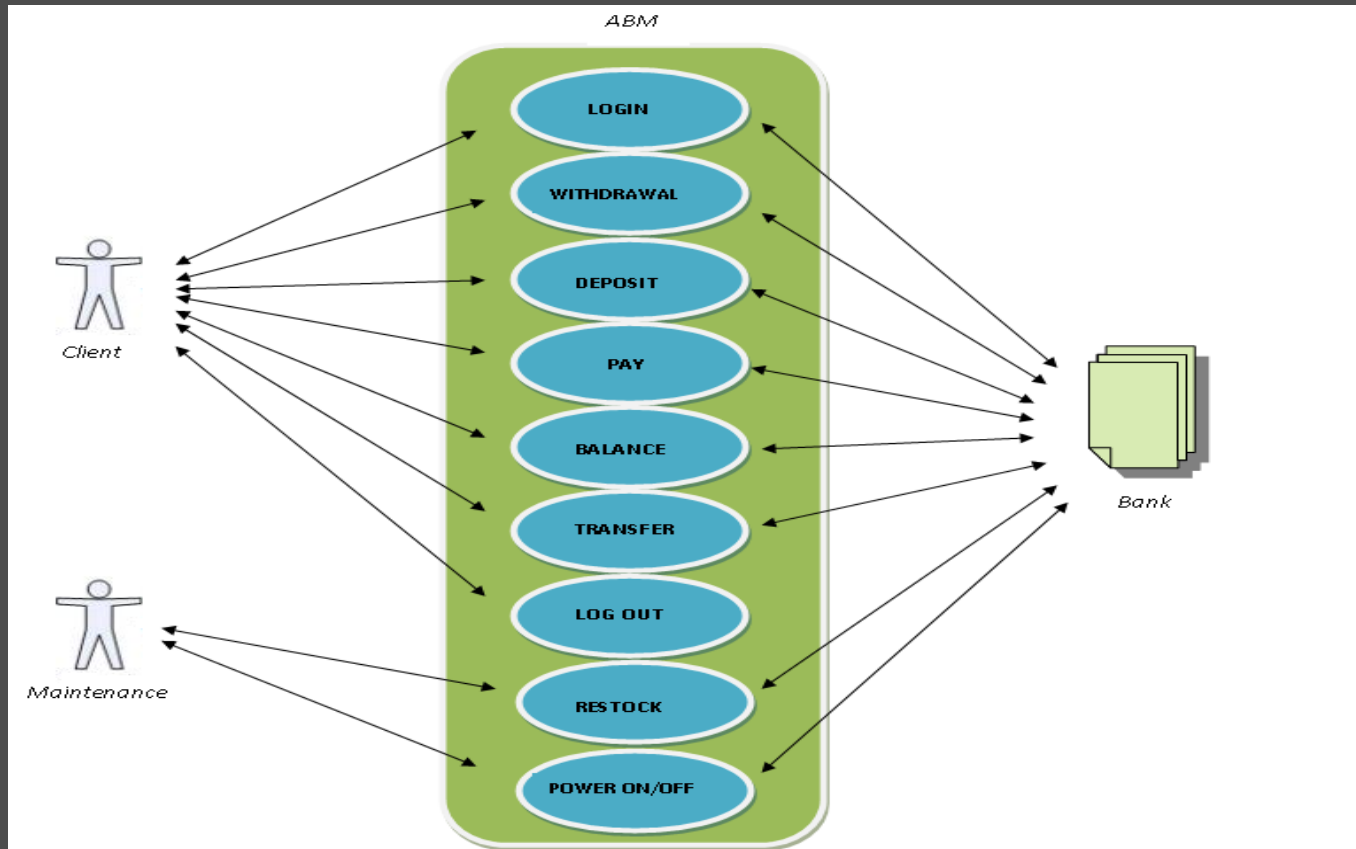

The Waterfall Process

SRS

- Complete description of the behavior/ requirements of system to be developed
 - Functional Requirements
 - What does the product need to do?
 - Nonfunctional requirements
 - What are the product constraints?

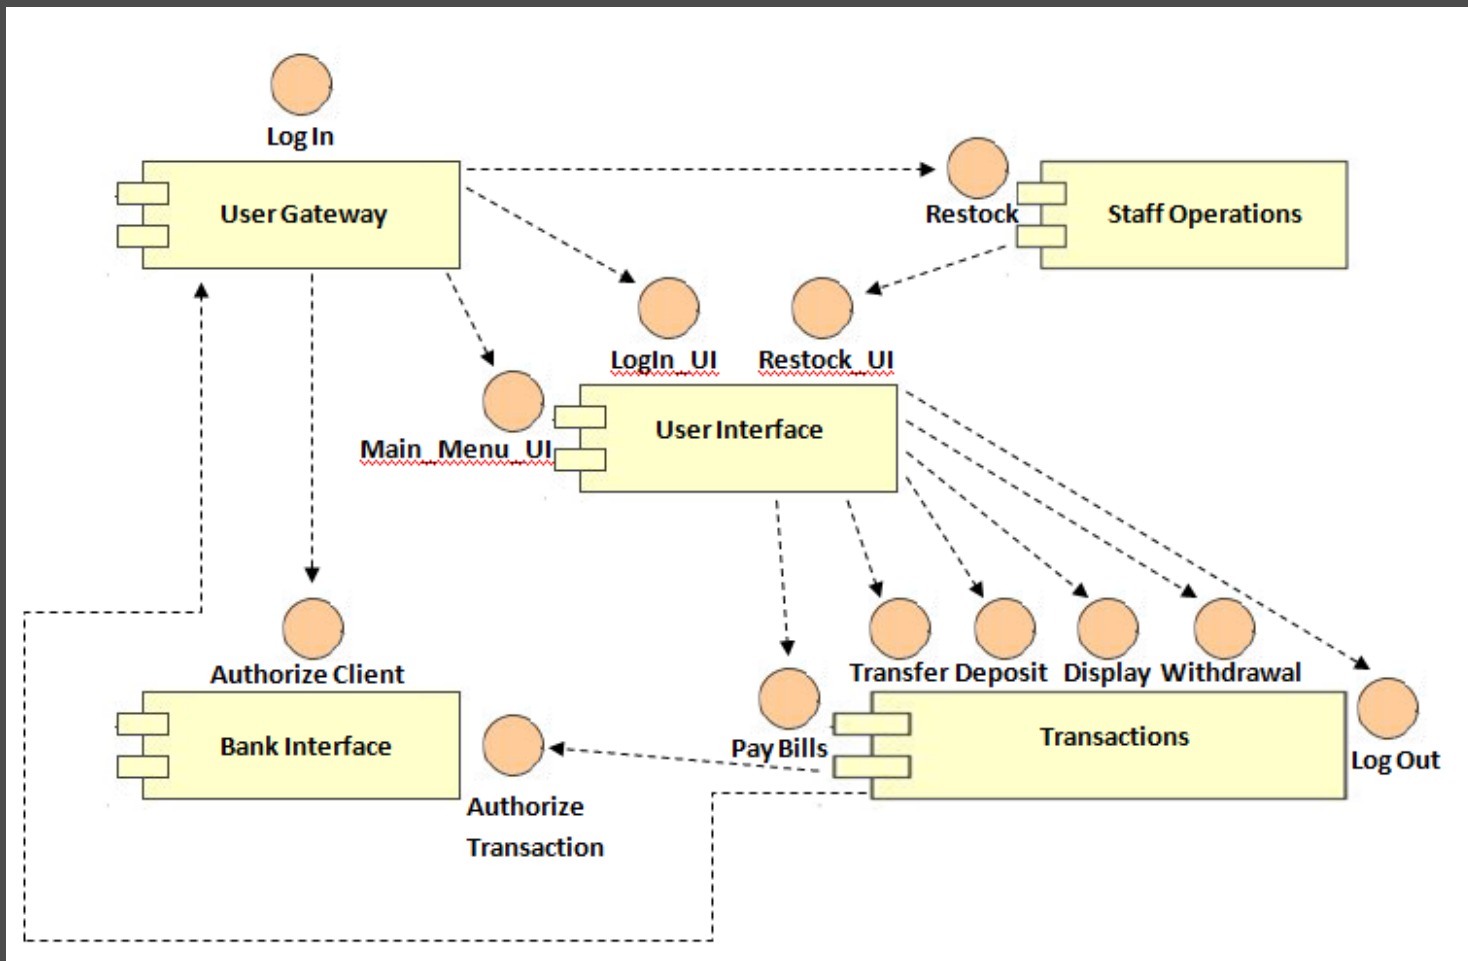

Use Case View

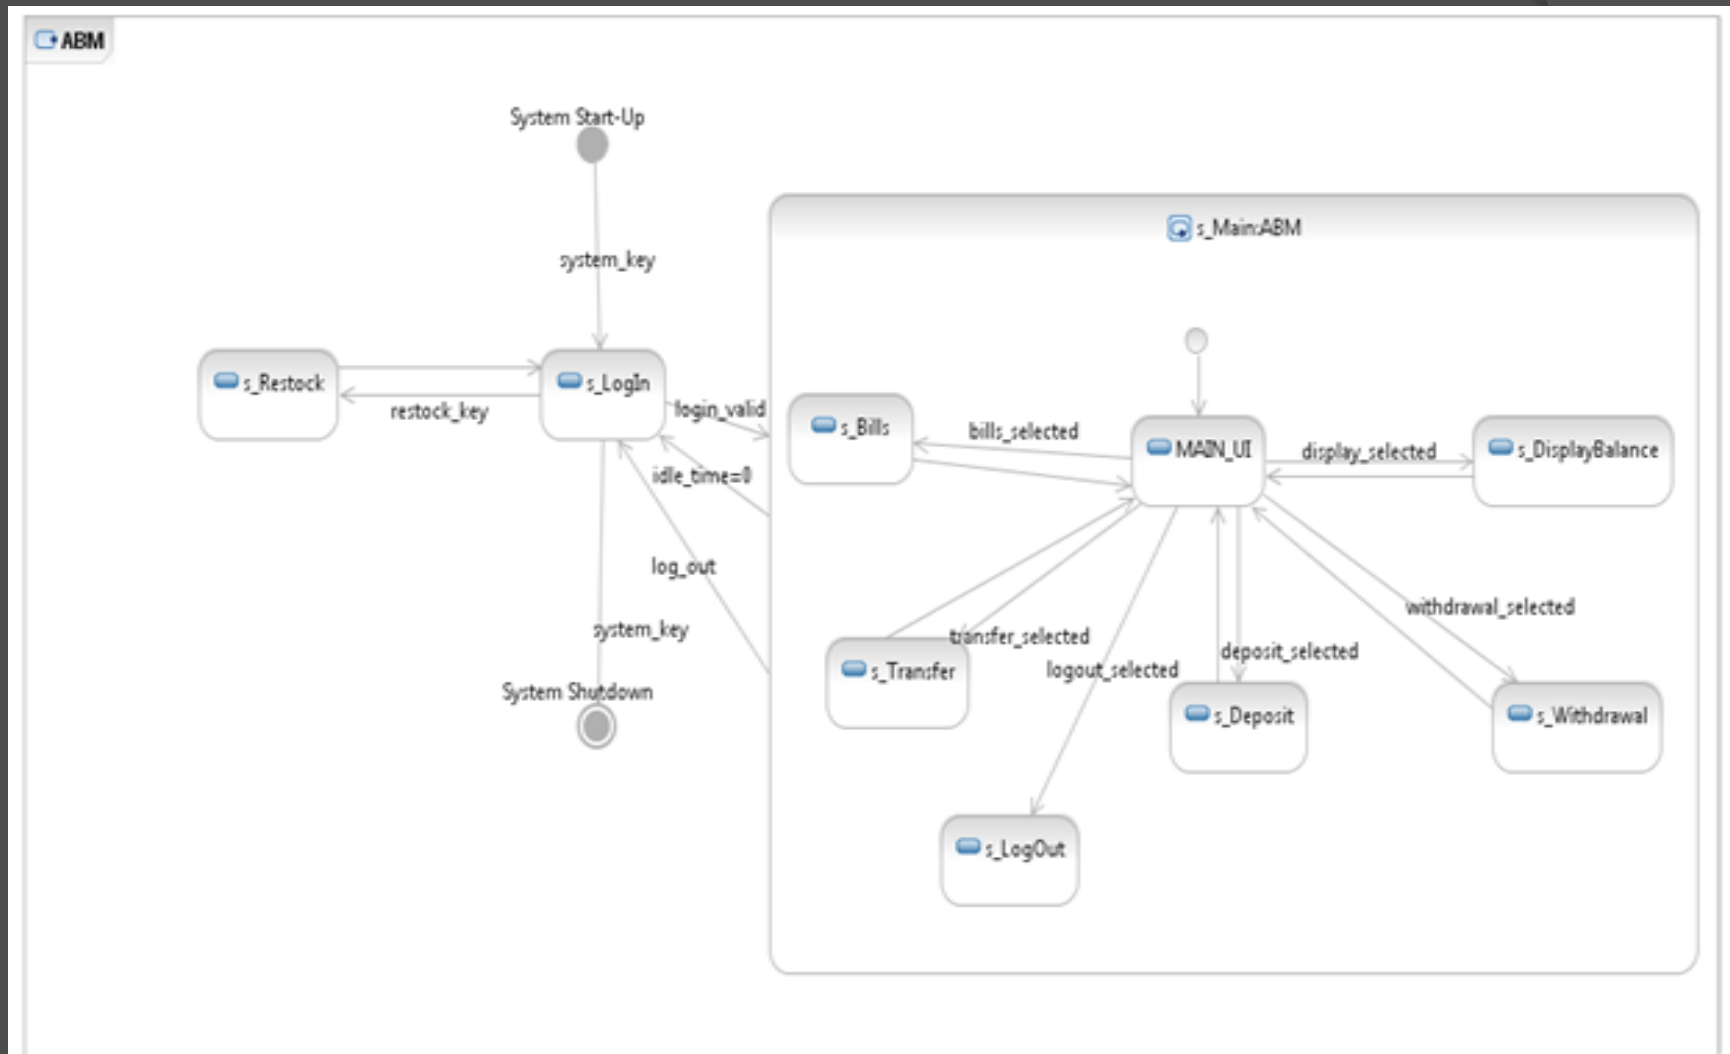

SDS

- Complete description of the software architecture/design and the rationale behind it
 - Architecture
 - Components
 - High level design
 - Interface interaction
 - Low level design
 - Modules

Implementation in Java:

User Interface

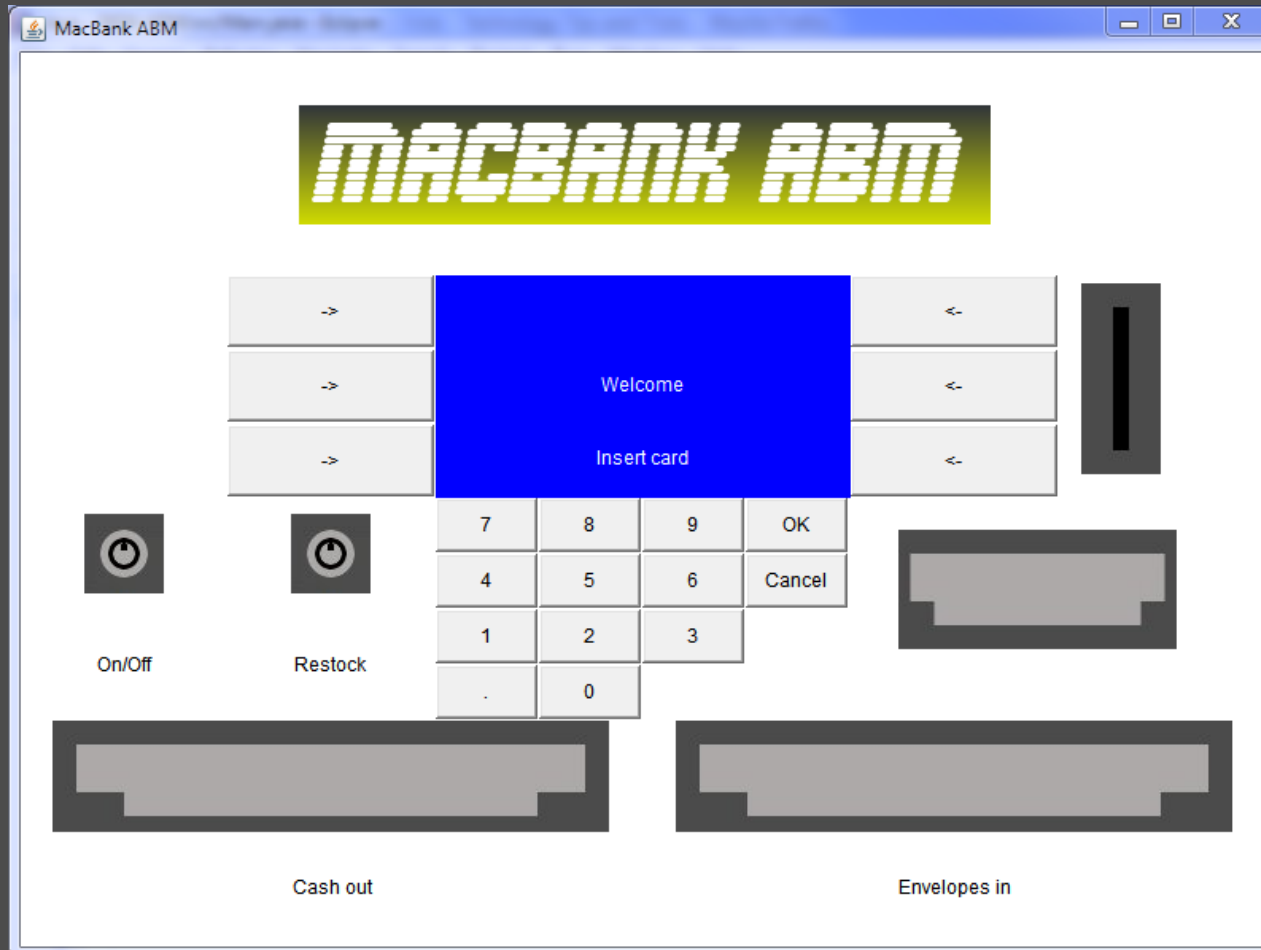

- Replicated the ABM system's hardware
- Implemented using the awt library
- Animations created with the canvas class and multithreading

Implementation in Java:

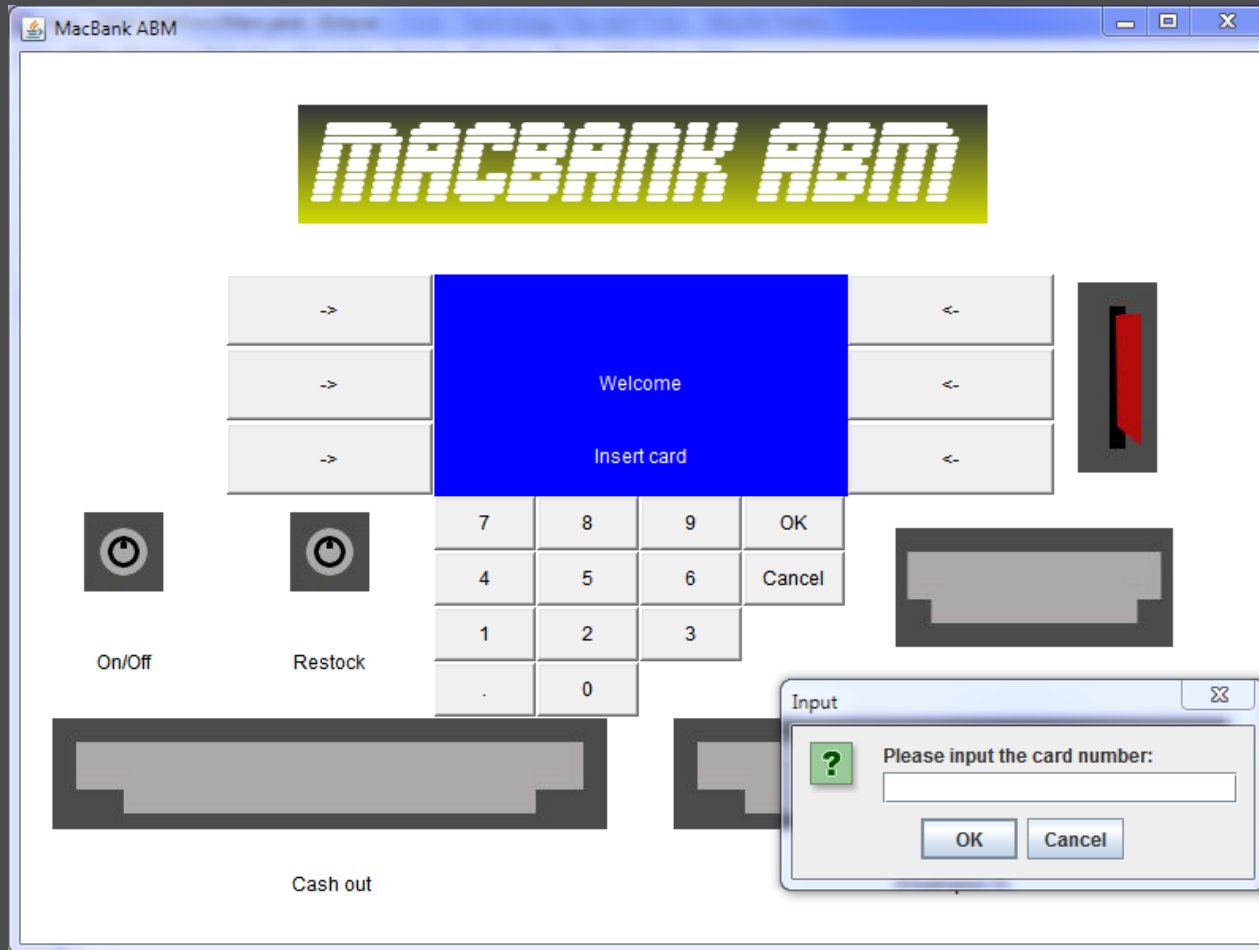

The Bank System

- ⦿ All data stored in a SQL database
- ⦿ HSQLDB was used since it is native to Java
- ⦿ Tables for:
 - Clients
 - Accounts
 - ABM
- ⦿ Implemented basic methods for other interfaces

Conclusion

- ⦿ Software development involves more than coding
- ⦿ Software documentation process provides excellent organization before implementation.

Suggestions for improvement:

- ⦿ For some of us, this is currently our fourth ABM implementation in either Java or C.
- ⦿ A previously unsolved problem would provide a better motivation for proper software documentation.
